

The State of Tuberculosis in New York City: The 2017 Data

Shama Ahuja, PhD, MPH
Director of TB Surveillance and Epidemiology
Bureau of Tuberculosis Control
New York City Department of Health and Mental Hygiene

ABOUT THE ANNUAL REPORT, 2017

- Summarize preliminary data for 2017 (reflect the most complete information available as of January 22, 2018)
- Includes summary of key bureau activities and highlights from the year
- Report is used:
 - To share data with key internal and external stakeholders
 - For provider outreach
 - For program planning

NYC BUREAU OF TUBERCULOSIS CONTROL KEY ACTIVITIES OVERVIEW

» MISSION: The Bureau of Tuberculosis Control (BTBC) aims to prevent the spread of tuberculosis (TB) and eliminate it as a public health problem in New York City (NYC)

GOALS

1 Identify all individuals with suspected and confirmed TB disease and ensure their appropriate treatment, identify and directly observed therapy (DOT)

2 Ensure that individuals at high risk for progression from latent TB infection to TB disease complete treatment and do not develop disease

ACTIVITIES

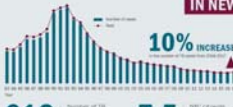

- Maintain a surveillance system for all TB cases and their contacts, all people suspected of having TB disease and children younger than 5 years of age with latent TB infection
- Ensure that providers and laboratories report suspected and confirmed TB cases to the New York City Health Department
- Conduct intensive case management to ensure that TB patients remain under medical supervision until treatment completion, with DOT as the standard of care
- Conduct contact investigations to identify individuals with TB disease or latent TB infection and ensure appropriate treatment
- Detect and respond to outbreaks to prevent the spread of TB
- Set standards and guidelines and consult on all aspects of TB control, including prevention, diagnosis and treatment of TB disease and latent TB infection
- Provide medical consultation and perform timely reviews of discharge plans submitted for hospital and providers
- Operate state-of-the-art chest clinics for TB screening, diagnosis and treatment at no cost to the patient
- Ensure that all positive cultures for *Mycobacterium tuberculosis* are sent to the NYC Public Health Laboratory for drug susceptibility testing and genotyping studies
- Use data to monitor trends, inform programmatic decision-making and conduct research and evaluation
- Address funding situations with program priorities
- Collaborate with community-based organizations and health care providers to improve TB prevention and management
- Support advocacy to maintain and improve the TB public health infrastructure
- Ensure data confidentiality

- Surveillance
- Clinical care
- Case management
- Contact investigation
- Genotyping
- Drug susceptibility testing
- Cluster investigation and outbreak detection/response
- Data analysis and research
- Outreach
- Support advocacy

YEAR AT-A-GLANCE: TUBERCULOSIS IN NEW YORK CITY, 2017

TUBERCULOSIS IN NEW YORK CITY, 2017

10% INCREASE
in TB cases in NYC in 2017

613 Number of TB cases reported in NYC in 2017

7.5 NYC reported TB rate per 100,000 people

14 Number of patients diagnosed in 2017 who had multidrug-resistant TB (MDR-TB) infection. 20 cases were also resistant to rifampin and isoniazid (RR-DR-TB)

75 Number of patients of birth origin from other countries who were newly diagnosed with TB disease

1 Number of patients diagnosed in 2017 who had extensively drug-resistant TB (XDR-TB) infection

7 Number of deaths in which TB was the primary cause of death among patients aged 15-64

12 Number of patients diagnosed with TB disease who were aged 65 or older

5% Proportion of TB cases among patients aged 65 or older

80% Proportion of TB cases among patients aged 15-64

83% Proportion of TB cases among patients aged 0-14

DEMOGRAPHIC CHARACTERISTICS

63% of TB cases reported among males

41% of TB cases reported among patients aged 15-64

43% of TB cases among 100% of cases reported among non-Hispanic Black patients

CLINICAL CHARACTERISTICS

5% Proportion of TB cases among patients aged 65 or older

80% Proportion of TB cases among patients aged 15-64

83% Proportion of TB cases among patients aged 0-14

REPORTED 6% INCREASE FROM 2002-2003

I. Executive Summary

New York City (NYC) has made enormous strides in tuberculosis control: the number of tuberculosis cases has declined by 70% since 1992. However, in 2003, the number of tuberculosis cases increased slightly for the first time in over 10 years, with 1,140 tuberculosis cases and a rate of 14.2 per 100,000. Despite the overall 10-year decreasing trend in tuberculosis in New York City, the rate of tuberculosis is 2.8 times higher than the national rate of 5.1 per 100,000 and 14 times higher than the Healthy People 2010 Objective of 1.0 per 100,000.

The increase in tuberculosis cases represents an excess of 56 cases over the number in 2002. This increase is partially the result of a change in case counting methods that occurred at the end of 2002, immigration from countries with high prevalence of tuberculosis and increased transmission of tuberculosis, in residences for homeless individuals.

Profile of Tuberculosis Cases

- Most tuberculosis patients were aged 20 to 64 years.

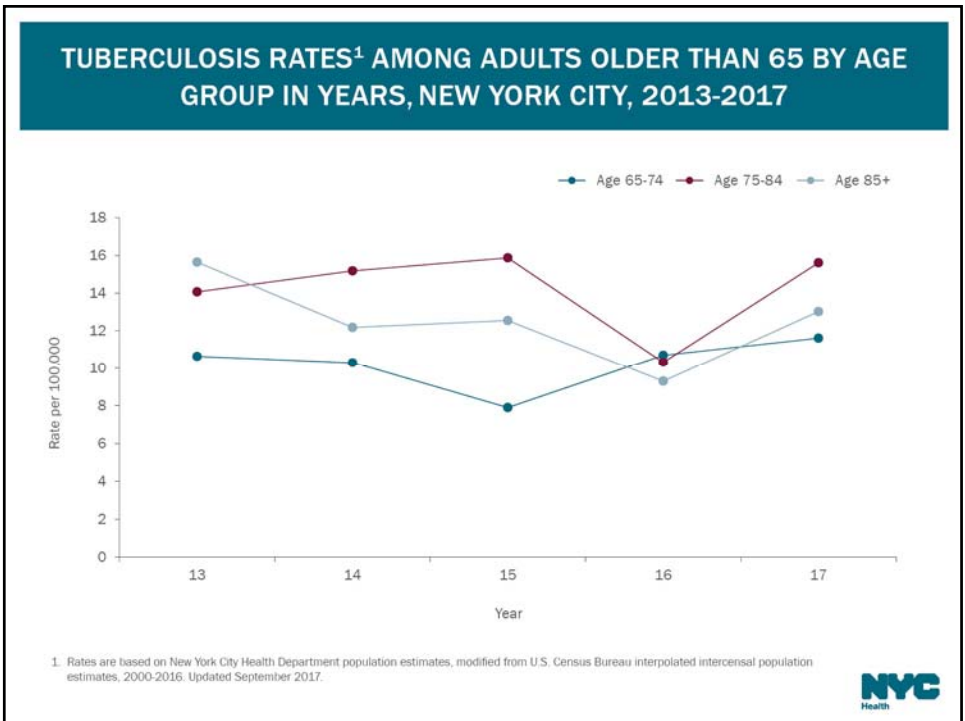

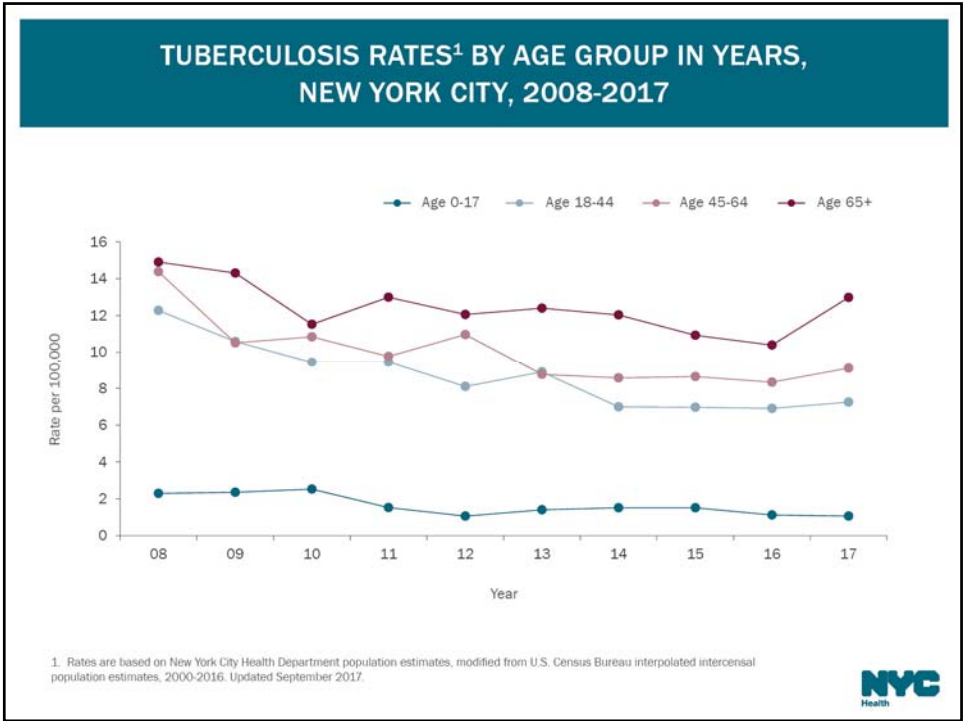

PERCENT CHANGE IN PROPORTION FOR SELECT CHARACTERISTICS AMONG TUBERCULOSIS CASES, 2016 TO 2017

NO CHANGE among patients 45-64 years of age, patients living in Staten Island at time of TB diagnosis or patients with HIV infection. Change in clustering proportion could not be assessed due to a change in genotyping and clustering methods.

1. Race/ethnicity is among patients born in the U.S. 2. MDR TB is defined as resistance to at least isoniazid and rifampin. 3. In the 12 months before TB diagnosis.

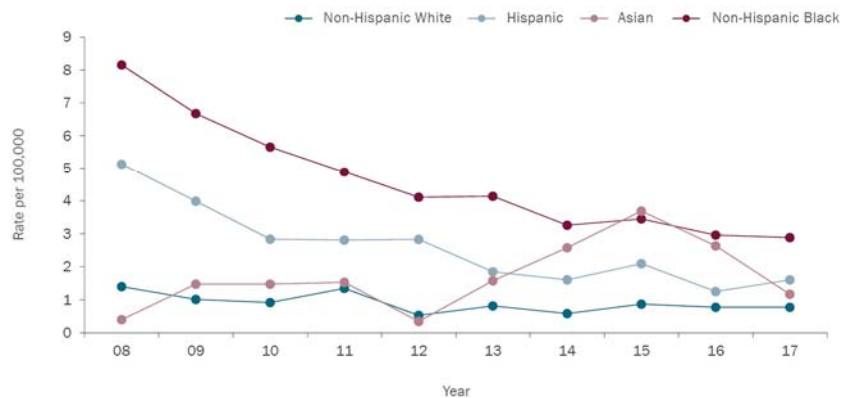

TUBERCULOSIS CASES AND RATES¹ BY BIRTH IN THE UNITED STATES (U.S.),² NEW YORK CITY, 1992-2017

1. Rates prior to 2000 are based on 1990 U.S. Census data. Rates for 2000-2005 are based on 2000 U.S. Census data. Rates after 2005 are based on one-year American Community Survey data for the given year or the most recent available data. 2. U.S.-born includes individuals born in the U.S. and U.S. territories. 3. Excludes cases with unknown country of birth.

TUBERCULOSIS RATES¹ AMONG PEOPLE BORN IN THE UNITED STATES (U.S.)² BY RACE/ETHNICITY, NEW YORK CITY, 2008-2017

1. Rates are based on one-year American Community Survey Public Use Microdata Sample data for the given year or the most recent available data. 2. Data shown does not include patients with multiple, other, or unknown race/ethnicity. 3. U.S.-born includes individuals born in the U.S. and U.S. territories. 4. Excludes cases with unknown country of birth.

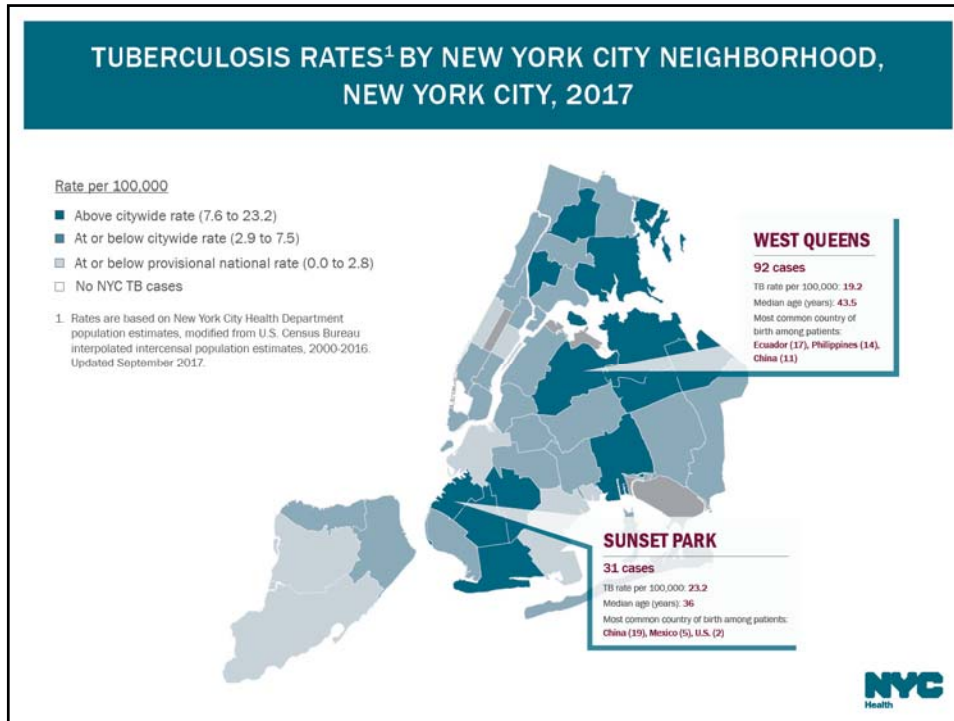

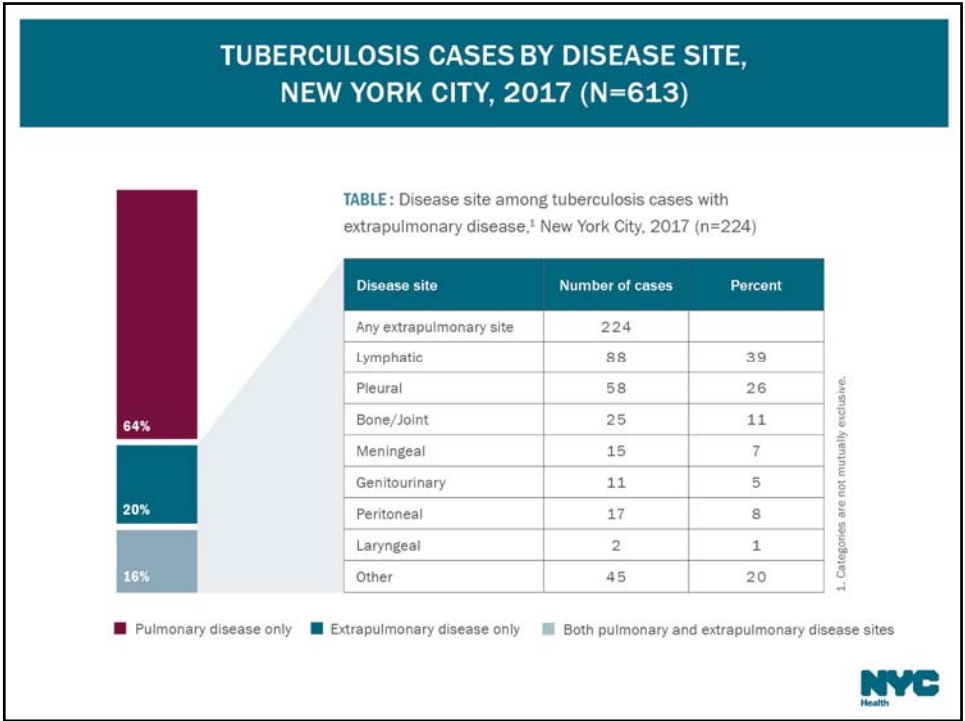

TOP TEN COUNTRIES OF BIRTH BY TUBERCULOSIS BURDEN AND INCIDENCE IN NEW YORK CITY,^{1,2,3} 2017

COUNTRY OF BIRTH	# OF NYC TB CASES	COUNTRY OF BIRTH	NYC TB RATE (PER 100,000) ¹
China ⁴	116	Eritrea	360
United States ⁵	83	Sierra Leone	225
Mexico	42	Bolivia	130
India	38	Burma	118
Ecuador	36	Indonesia	112
Dominican Republic	31	Ethiopia	93
Bangladesh	27	Nepal	86
Philippines	25	Liberia	78
Haiti	19	Afghanistan	66
Nigeria	15	Nigeria	57

NYC Health

1. Rates are based on 2016 American Community Survey one-year sample data. 2. Two cases in 2017 were among patients with unknown country of birth. 3. There were 16 countries for which rate could not be calculated due to insufficient population data. 4. China includes individuals born in mainland China, Hong Kong, Taiwan and Macau. 5. U.S.-born includes individuals born in the U.S. and U.S. territories. 6. Immunosuppression due to having a medical condition, not including HIV/AIDS, or use of immunosuppressive therapy. 7. MDR TB is defined as resistance to at least isoniazid and rifampin.

HIV INFECTION AMONG TUBERCULOSIS CASES BY BIRTH IN THE UNITED STATES (U.S.), NEW YORK CITY, 1992-2017

CONTACT INVESTIGATIONS IN NON-HOUSEHOLD SETTINGS¹ BY SITE TYPE, NEW YORK CITY, 2017 (N=69)

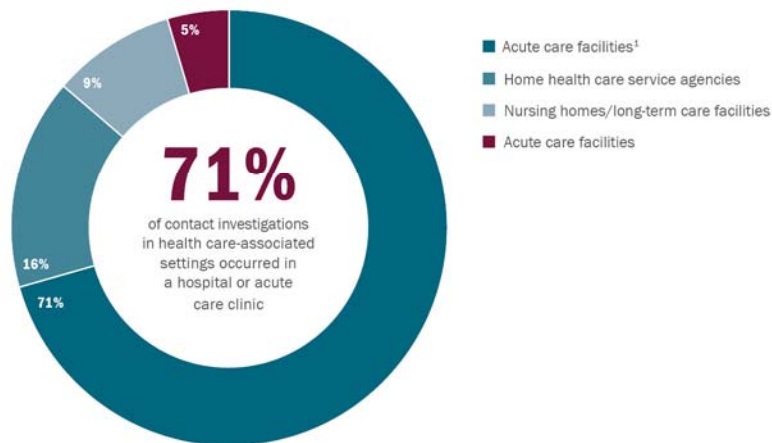

TABLE: Contact investigation outcomes in non-household settings¹ by number of exposed contacts, New York City, 2017 (n=69)

	≥ 15 exposed contacts	< 15 exposed contacts	Total
	n (%)	n (%)	n (%)
Number of sites	28	41	69
Likely transmission ²	8 (31%)	7 (19%)	15 (24%)
Transmission could not be assessed	2 (7%)	5 (12%)	7 (10%)
Total number of contacts	849	249	1,098
Median contacts per site (range)	25 (15-89)	6 (1-14)	10 (1-89)
Contacts eligible for testing ³	810 (95%)	233 (94%)	1,043 (95%)
Contacts tested	709 (88%)	207 (89%)	916 (88%)
Contacts with a positive TB test result	75 (11%)	28 (14%)	103 (11%)

1. Excludes health care-associated investigations (n=153)
 2. Proportion calculated among investigations where transmission could be assessed
 3. Contacts eligible for testing are defined as contacts without a known history of TB disease or documented positive test for TB infection who were alive subsequent to the diagnosis of the infectious TB case to whom they were exposed

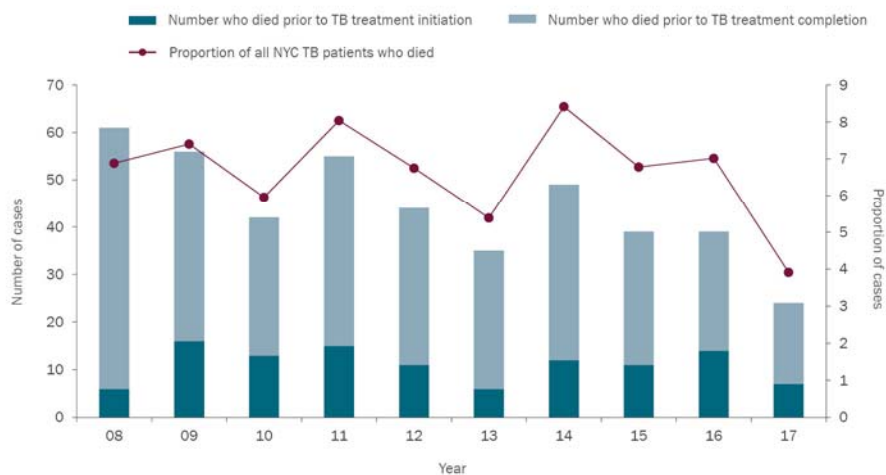

CONTACT INVESTIGATIONS IN HEALTHCARE-ASSOCIATED SETTINGS BY SITE TYPE, NEW YORK CITY, 2017 (N=153)

NUMBER AND PROPORTION OF PATIENTS WITH TUBERCULOSIS WHO DIED BEFORE OR DURING TREATMENT, NEW YORK CITY, 2008-2017

1. A death is defined as any patient who died prior to or during TB treatment, regardless of the cause of death. This excludes any patient who died after the completion of TB treatment.
